

Next-Gen Security & Advanced Intelligence

Policy-Driven Information Lock

QR Attendance system

Seamless and touchless attendance management for employees and visitors through secure QR-based login/logout.

Premises Restrictions

Policy-based automated blocking of cameras and apps like Facebook strictly within the organization's premises.

MDM & App Control

Centralized mobile device management to push restrictions and monitor compliance across registered devices.

Executive Summary

The Policy-Driven Information Lock (PIL) Mobile Application is an enterprise-grade mobile security solution designed to enforce operational compliance and restrict unauthorized device usage in sensitive workplace environments.

Key highlights of the platform include

The application enables organizations to control mobile device features such as camera access, application usage, and system permissions while employees are present within designated restricted areas.

The platform helps organizations prevent data leakage, unauthorized photography, and misuse of mobile devices in confidential operational zones. The platform helps organizations prevent data leakage, unauthorized photography, and misuse of mobile devices in confidential operational zones.

The solution provides organizations with a scalable and reliable platform to enforce workplace security policies and maintain operational integrity.

Platform Overview

The PIL platform is designed as an enterprise mobile device management and security enforcement system. It allows organizations to apply temporary device restrictions when employees enter restricted work environments

Core system components include

1. Mobile Application

Ensures secure and fast financial processing while maintaining a detailed transaction ledger.

2. Security Policy Engine

Ensures secure and fast financial processing while maintaining a detailed transaction ledger.

The system ensures that mobile devices operate only within approved security policies during active work sessions.

3. QR Authentication System

Ensures secure and fast financial processing while maintaining a detailed transaction ledger.

4. Security Policy Engine

Ensures secure and fast financial processing while maintaining a detailed transaction ledger.

5. Activity Logging System

Ensures secure and fast financial processing while maintaining a detailed transaction ledger.

This architecture enables organizations to enforce security rules without permanently controlling the employee's device.

System Objectives

The primary objective of the PIL platform is to help organizations enforce operational compliance within restricted environments.

The system focuses on

Monitoring compliance with organizational policies

Protecting sensitive workplace information

Restricting device usage in secure areas

Preventing unauthorized photography

Maintaining operational discipline

The platform ensures that mobile devices remain securely controlled during work sessions without affecting personal device usage outside the restricted environment.

QR-Based Login System

The application uses a secure QR code login mechanism to activate workplace security policies.

The system two process Include

1. Login Process

Employee opens the PIL application.

Device restrictions immediately become active

Once the QR code is verified, the system activates the security session.

The system prompts the user to scan the organization-provided login QR code.

2. Logout Process

The device returns to normal operation.

Employee scans the logout QR code.

Security policies are removed.

This process ensures that restrictions remain active only during the employee's working session.

Device Restriction System

The core feature of the platform is its device restriction system which enforces enterprise security policies during active sessions.

Key restrictions include

1. Camera Restriction

The application disables the device camera to prevent unauthorized photography in restricted environments.

2. Application Monitoring

Selected applications can be restricted or monitored to prevent unauthorized usage.

3. Device Behavior Monitoring

The system monitors attempts to modify critical device settings that may compromise security enforcement.

These restrictions remain active until the employee logs out of the session.

Accessibility Service Integration

The PIL application uses Android Accessibility Service APIs to monitor system-level activities that may impact security enforcement. The accessibility service allows the application to detect attempts to

Disable required permissions

Force stop the application

Modify security-related settings

Remove device administrator privileges

This monitoring ensures that the organization's security policies cannot be easily bypassed. The service operates strictly within the scope of enterprise compliance monitoring.
